Digital media activation method for digital media player in public places , involves altering sequence of digital media files in queue , based on currency units associated with each file in queue

Alerting Abstract ...NOVELTY - Each of multiple users is allowed to add currency units to selected digital media files (32) in the media gaming queue . The sequence of digital media files in the queue are altered, based on the respective currency units associated with each digital media file in the queue . A digital media player is activated to the media files in altered sequence from queue . DESCRIPTION - An INDEPENDENT CLAIM is also included for system for controlling order of activating digital media files...

...USE - For activating digital media such as floppy disk, compact disk (CD)-ROM, hard drive for playing music in public places such as bar, restaurant, dance hall, billiard parlor and other public or private social venues by digital media player using wireless device such as laptop computer, mobile phone and personal digital assistant (PDA...

...ADVANTAGE - Enables remote activation of the digital media player by wireless device, efficiently...

...DESCRIPTION OF DRAWINGS - The figure shows the schematic diagram of the digital media activation order control method...

...32 digital media files

Title Terms.../Index Terms/Additional Words: QUEUE ;

Class Codes

International Classification (Main): G06F-017/60

Original Publication Data by Authority

Original Abstracts:

Systems and techniques are described enable the remote activation of

digital **media** from a personal device over a network. The techniques **include** one or more users browsing a repository of **media** files using a wired or wireless device and selecting **media** files from the repository for inclusion in a public **queue**. Every user may view the public **queue** on his own wireless device and **add** value to a **media** file in the **queue**. The file with the most associated value plays next over a playback device.

Claims:

What is claimed is: b 1 /b . A method of activating digital **media** on a network comprising: allowing each **user** connected to the network to **add** digital **media** files to a **media** gaming **queue** accessible to each **user** of the network; **providing** a visual indication of a sequence of the digital **media** files in the **media** gaming **queue**; allowing each **user** to **add** currency units to one or more selected digital **media** files in the **queue**; altering the sequence of the digital **media** files in the **queue** based on the respective currency units associated with each digital **media** file in the **queue**; and activating a digital **media** player to play the digital **media** files in sequence from the **queue**.

Network-based order list provision method using set -top box, involves creating ordered list of available products by evaluating available products, based on consumer preference and providing to consumer

Original Titles:

System and method for providing an **ordered** listing of available, currently broadcasting, and/or acquired products based on predicted relevance

Alerting Abstract ...NOVELTY - A **delivery** schedule listing a number of available **products** , is received from a server (110) through network (170). An **ordered list** of available **products** is created, by evaluating the available **products** based on the **consumer** preference and is **provided** to the **consumer** (130).DESCRIPTION - INDEPENDENT CLAIMS are also **included** for the following...

...network-based **order list** provision system; and machine readable

medium storing instruction for **providing order list** .

...

...USE - For **providing** list of **ordered products** such as television program, **movie** , **music** data, audio-video data, video game computer programs, graphics, using **set** -top box and personal computer connected to local area network (LAN...

...ADVANTAGE - Enables the **consumer** to view a list of available programs and stored programs in predicted relevance **order** . Enhances the **consumer** ability to easily locate the programs that the **consumer** most likely prefer to view, watch access and play...

...DESCRIPTION OF DRAWINGS - The figure shows an explanatory drawing explaining the network-based **order list** provision method...

...130 **consumer**

International Classification (Main): **G06F-017/60**

Original Publication Data by Authority

Original Abstracts:

A system and method for **providing** an **ordered** listing of currently playing, available and/or acquired **products** based on predicted relevance. A method comprises receiving a **delivery** schedule from a server listing a plurality of available **products** available from the server, creating an **ordered list** of available **products** by evaluating the available **products** based on **consumer** preferences, and presenting the **ordered list** of available **products** to the **consumer** . Another method similarly **includes** creating an **ordered list** of available **products** by evaluating stored **products** based on **consumer** preferences, and presenting the **ordered list** of stored **products** to the **consumer** . Yet another method **includes** creating an **ordered list** of currently playing **products** based on **consumer** preferences, and presenting the **ordered list** to the **consumer** . The method may be implemented on a **set** -top box or other personal computing device coupled to a television display and a **delivery** center server.

Claims:

...is claimed is: b 1 /b . A method comprising: obtaining a plurality of consumer preferences; receiving a **delivery** schedule from a server listing a plurality of available **products** available from the server; creating an **ordered list** of available **products** by evaluating the plurality of available **products** based on the consumer preferences; and presenting the **ordered list** of available **products** to the consumer.

Moving image title delivery scheduling method in video on-demand system, involves initializing queuing time to set position of requested title which is delivered to user based on priority

Original Titles:

METHOD AND DEVICE FOR SCHEDULING **DELIVERY** OF MOVING PICTURE **TITLE**

Alerting Abstract ...NOVELTY - The method involves judging whether the **title** of an image requested by a **user** is already requested by any other **user**. The standard arrangement position of the **title** is **set** based on an initialized queuing time, when the **title** is not requested by another **user**. The **title** is **delivered** to a **user**, based on **priority**.
DESCRIPTION - An INDEPENDENT CLAIM is also **included** for moving image **title delivery** schedule device...

...USE - For **delivering** the digital moving image **title** from video server to image receiver device of user terminal via band share type network, in video on-demand system, for viewing **movie** in home...

...ADVANTAGE - Improves overall throughput, potentiating viewing and listening of **title** desired by user...

...DESCRIPTION OF DRAWINGS - The figure shows the block diagram of moving image **title delivery** scheduling device. (Drawing **includes** non-English language text).

Alerting Abstract US A1

NOVELTY - An item display control table has display codes associated with an estimation classification of a bid target and a bid participant classification indicating display state of multiple bidding items, assigned to respective items. A display screen displaying multiple items based on the respective display codes searched from the table using the information contained in bid data, is generated for bid participants.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.method for generating display screen for bid participant; and
- 2.computer readable medium storing instruction for displaying screen for bid participants.

USE - For controlling bid performed for purchasing goods and receiving service, through internet.

ADVANTAGE - Erroneous input and update of items by bid participants are prevented, since the display screen is controlled based on the status of the bidding.

DESCRIPTION OF DRAWINGS - The figure shows a network configuration including the bid controlling system.

Alerting Abstract US A1

NOVELTY - A particular rate adoption rate adopted by identified trendsetters who are characterized as relatively early adopters of items that later become relatively popular within community of subscribers is measured. The particular item recommendations provided by the recommender system are modified based on measured adoption rate.

DESCRIPTION - An INDEPENDENT CLAIM is also included for system for providing recommendation of items to community of online subscribers.

USE - For influencing behavior of electronic recommender system, for monitoring particular item like product, service, content and market security of company e.g. AOL, Yahoo, Amazon, EBay, Netflix, Google and Doubleclick used by online users and subscribers, in e-commerce applications.

ADVANTAGE - Improves the performance of e-commerce website, effectively by analyzing the behavior of trendsetters.

DESCRIPTION OF DRAWINGS - The figure shows the flowchart explaining the behavior influence method of electronic recommender system.

Alerting Abstract US A1

NOVELTY - The method involves identifying early adopter units of an online community. The early adopter units are characterized by a demand behavior for items which leads and are imitated by other units of the online community. An acceptance value for a particular item is measured by the early adopter unit of the online community. A demand score identifying a predicted overall remaining demand for the particular item is generated.

DESCRIPTION - An INDEPENDENT CLAIM is also included for a system for identifying demand by an online community for a particular item.

USE - Used for identifying a demand of an item e.g. a product, service, content, and market security.

ADVANTAGE - The method allows identifying whether specific persons are the initial adopters to query/view certain content, and to buy a particular product, or to try a particular service.

DESCRIPTION OF DRAWINGS - The drawing shows a flow chart of the steps performed by a trendsetter evaluation and feedback process.

Alerting Abstract US A1

NOVELTY - The method involves setting up policies for influencing recommendations given by recommender system to user and responding to request for recommendation. The recommender system is caused to use policies, when presenting the policy influenced recommendations to user in response to request.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

1.a method of presenting advertising in conjunction with recommendations;
and

2.recommender system.

USE - For operating recommender systems used in electronic commerce system for influencing behavior of automated interactive software agents using web sites over internet.

ADVANTAGE - Avoids conflicts and redesign of commercial recommender system software packages. Minimizes the overall cost of the system and optimizes the performance of the system.

DESCRIPTION OF DRAWINGS - The figure shows the flow diagram explaining the behavior and recommendations of recommender system.

Alerting Abstract US A1

NOVELTY - The adoption behavior of items exhibited by a first member of an online community, is measured and ranked against the adoption behavior of other members in the community. The advertisement presented to the first member during a latter online session, is dynamically adjusted based on the ranked adoption behavior.

USE - For implementing online advertising of items such as books, auction articles, music recordings, service, online news story, video, comment, web page, or interface customization, to subscribers of e-commerce website, using customer network device such as desktop computer, laptop computer, personal digital assistant (PDA), cell phone, cable television, satellite receiver or digital subscriber line (DSL) receiver, through network such as local area network (LAN), wide area network (WAN) or internet.

ADVANTAGE - Provides better customization of site and improves the overall experience for subscribers of e-commerce website.

DESCRIPTION OF DRAWINGS - The figure shows a flowchart explaining the trendsetter evaluation and feedback process.

Alerting Abstract US A1

NOVELTY - The method involves identifying adoptions of particular item by user, and ranking the adoptions to identify and provide trendsetter ratings to user who are early adopters of the item. The identifying and ranking process are repeated for another item, and an ordered list of trendsetters is generated based on trendsetter ratings of two items.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.method of identifying trendsetters within subscriber population; and
- 2.system for identifying trendsetters.

USE - For identifying trendsetters for predicting future product/service trends, evaluating advertising techniques, identifying collectible items such as books, auction articles, music recordings, services, human readable contents, computer in electronic auction, influencing search engines and recommender systems, through internet.

ADVANTAGE - Enables to test, rate and report the adoption rate and/or expected demand for a particular item, effectively.

DESCRIPTION OF DRAWINGS - The figure shows the flow diagram explaining the trendsetters identifying method.

NOVELTY - A subscriber delivery queue (106) including a list of playable media items to be delivered to the subscriber, is set up in response to the item selection directions provided by the subscriber. Delivery rules including a randomized delivery option for shipping the playable media items to the subscriber in a random sequence, are set up for the delivery queue.

USE - For distributing playable media items e.g. movie readable by subscriber device such as DVD player, audio compact disk read only memory (CD-ROM) player, video receiver, desk top computer, laptop computer, personal digital assistant (PDA) and cell phone, through wide area network (WAN), local area network (LAN) or internet.

ADVANTAGE - Enhances profitability as well as customer satisfaction and further enhances usability and marketability of service provider system. Facilitates users to benefit from a large population of preference and interest data. Eliminates the need for additional processing logic on the server side.

DESCRIPTION OF DRAWINGS - The figure shows an illustration of a queue status interface adapted for assisting users/subscribers to monitor the status of a rental queue.

- 100 queue status interface
- 105,111,115 display areas
- 106 subscriber delivery queue
- 110,116 subscriber selection queues
- 120 electronic activator
- 125 header

Alerting Abstract US A1

NOVELTY - The method involves specifying a set of subscriber selection rules to be satisfied by media titles. The titles offered by a media rental service are inspected to determine if the titles meet subscriber availability rules and status. A report is generated to the subscriber identifying the titles that satisfy the subscriber selection rules. Selected titles are placed into a subscriber delivery queue (116).

USE - Used for monitoring availability of a DVD movie title.

ADVANTAGE - The method automatically inspects the media titles for the subscriber, and without requiring the subscriber to inspect such media titles, thus saving cost and time of the method.

DESCRIPTION OF DRAWINGS - The drawing shows a queue status interface employed in a DVD movie title availability monitoring method for assisting users/subscribers to monitor status of a rental queue.

100 Queue status interface
105,111,115 Display area
106 Titles Out Queue
116 Subscriber delivery queue
125 Header

Alerting Abstract US A1

NOVELTY - A computer of the internal system is programmed to process the set of mortgage loan application data received through the website, in parallel and displays the status of each set of mortgage loan application data simultaneously. A controller harnesses the website to the internal system so that user can access the internal system to retrieve the computer processed mortgage loan application data.

DESCRIPTION - An INDEPENDENT CLAIM is included for on-line mortgage loan application data processing method.

USE - For processing and tracking of mortgage loan applications between mortgage brokers and correspondents through website.

ADVANTAGE - Makes the process a more efficient experience for the browsers, because the system collects the information in one place, the information is consistent, discrepancies are found automatically and resolved prior to closing. Since the system can store and evaluate hundreds of products against the borrower's circumstances, it can filter out those that are not appropriate and present all those that remain with their various advantages, hence the originator does not have to rely on memory to know what products fit the borrower's needs. Simplifies locating and understanding the information as well as loan processing, since the presentation includes both website informational architecture as well as graphical appearance of it.

DESCRIPTION OF DRAWINGS - The figure shows a block diagram of the mortgage loan application processing system.

Alerting Abstract FR A1

The fraud detection operates on pre-paid electronic payment cards. A model of the payment units normally consumed by each type of payment terminal is established. Each type of payment terminal computes measures of consumption of payment units over known time intervals, by determining the number of units consumed, the number of transactions and the error range of the consumption distribution.

At the end of the monitoring interval each terminal sends these measures to the central computer. The central computer compares these measures to the model for the terminals, and under pre-set criteria determines whether there are anomalies. If anomalies are detected further transactions are refused.

USE/ADVANTAGE - Increased security for "electronic wallets". Protection from fraud derived from theft of cards during the last stage of fabrication, or forging of cards.

Title Terms/Index Terms/Additional Words: DETECT; FRAUD; PAY; PRE; CARD; DEVIATE; STATISTICAL; DISTRIBUTE; TERMINAL; TYPE; ELECTRONIC; WALLET

ABSTRACT: One product that distributors know will be in constant demand from customers is checks. Although there may be fluctuations in the type of check products (continuous vs. laser, for instance), the product itself is still a necessity, say manufacturers. Product niches within the category reflect customers' desire for convenience. Continuous checks are declining as customers move to cut-sheet and value-added products, said Bill Reid, Printegra's director of marketing.

Introduction: The critical structuring issues facing multinationals in

Latin America

Castillo, Nicasio del; **Gross, Jorge A** ; Pupo, Eduardo; Toro, Roberto del; Salerno, John A

ABSTRACT: During the 1990s, rapid economic growth in Latin America's largest economies fuelled a wave of investment by multinational companies based in Europe and the US. As economies grew and foreign investment restrictions were eased, funds began to flow freely into the region. However, with the dawn of the new millennium, the economic crises in Argentina and Brazil, and the uncertain political climate in such countries as Venezuela, have caused multinationals to take stock of their Latin American investments. Regardless of how the environment has affected particular companies, one common theme has been a heightened focus on the returns that Latin American businesses generate. With a goal of optimizing rates of return in difficult market conditions, multinationals doing business in Latin America have begun to rethink traditional business and investment structures. This article provides an overview of some of the more relevant pan-regional structuring issues facing multinationals with significant investments in Latin America. Among these is the rationalization of product supply chains, the management of an efficient capital structure, the repatriation of earnings, and the centralization of subsidiary ownership.

The 'Littery Supplement' Comes of Age: A History, of Sorts, of the Book Review

John Gross
New York Times, Late Edition - Final ED, COL 1, P 9
Sunday October 6 1996
DOCUMENT TYPE: Newspaper JOURNAL CODE: NYT LANGUAGE: English
RECORD TYPE: Fulltext
Word Count: 3729

ABSTRACT:

Comment by John Gross recalls start of The New York Times Book Review one hundred years ago, its quaint early flavor and mixed reaction in some literary circles; photos (M)

LEAD PARAGRAPH:

When Adolph S. Ochs acquired control of The New York Times in 1896, one of the first things he did was establish a separate book section. He was intent on improving the paper's coverage, and the world of books was one area where it seemed to him that there was more going on than the previous owners of the paper had allowed for. He was right. The closing years of the 19th century were a period of spectacular growth for publishing, matched by a steady expansion of the reading public. Books were multiplying, and books

were news.

Naturally book reviews weren't an innovation in themselves. The old, pre-Ochs Times had carried its fair share of them. But they appeared in the already crowded news columns, where they had had to fight for space and prominence with a hundred other topics. The new book section meant that many more titles could be reviewed than before, often at greater length, and it provided a focus for stories about books and authors, which had previously been scattered around, more or less at random.

NEW YORK; AN UNEVEN FILM ABOUT JOE ORTON THAT COULD HAVE USED HIS LEFT HAND

John Gross

New York Times, Late City Final Edition ED, COL 1, P 43

Sunday May 17 1987

DOCUMENT TYPE: Newspaper JOURNAL CODE: NYT LANGUAGE: English

RECORD TYPE: Fulltext SECTION HEADING: SECT2
Word Count: 1129

LEAD PARAGRAPH:

THE BEST PLACE TO meet a writer, it has been said, is on the page (or on the stage, or wherever else his work appears). I don't think the British playwright Joe Orton would have dissented. At all events, he once told an interviewer that, unlike Oscar Wilde, he thought that a writer should put his genius into his work, not into his life.

THE WRECK OF THE TITANIC FORETOLD? Edited by Martin Gardner.
Illustrated. 157 pages. Prometheus Books. \$18.95.

MORGAN ROBERTSON (1861-1915) was the son of a Great Lakes ship captain who became a sailor himself and then turned to writing sea stories. He enjoyed considerable popularity in his own time, but he would scarcely be remembered today if it were not for a short novel that he published in 1898.

Abstract: The data generated by the Hubble Space Telescope pose a series of special **requirements** for the analysis process. The Hubble Space Telescope (HST) is being operated in a semi-autonomous, pre-programmed manner, executing a **queue** of observing requests. Calibration is being done "institutionally", i.e. not in response to individual observing programs, but in the same manner for all users. Data **products** are being generated for the observers, and they are ingested in the HST science data archives, to make them available for further exploitation through the Virtual Observatory. **Added value products** can be generated by combining data from different programs. Interactive analysis tools are being **supplied** to support **users** in the optimum exploitation of the data.

Treatment: Applications (A); Practical (P); Theoretical (T)

Abstract: One of the main and required characteristics of multimedia systems is the user-interaction service. The user-interaction service is an essential **requirement** in some applications, e.g., Video-On-Demand (VOD) and News-On-Demand (NOD). The **user** -interaction service **provides** flexible multimedia presentations with **user** interactions. That is, **users** are allowed to have on-line adjustment of the presentation flow, e.g., skip some (boring) **media** units or reverse the presentation **direction**, to have some special features. In this paper, we propose an Interactive Extended Finite State Machine (IEFSM) model to **specify** synchronization issues in multimedia presentations with **user** interactions. By incorporating interrupt transitions and dynamic transitions in the IEFSM model, dynamic behaviors resulting from user interactions can be modeled using some IEFSMs. Using the IEFSM model, intra-medium synchronization is handled by an Actor, which is formally represented as an IEFSM; inter-**media** synchronization is handled by a Synchronizer, which is also formally represented as an IEFSM. The communication between IEFSMs is message-passing through some First-In-First-Out (FIFO) **queues**. In this way, the dynamic behaviors of user interactions, **including** reverse, skip, freeze-restart, and scale can be represented in IEFSM-based multimedia synchronization **specifications**.

Treatment: Practical (P)

Abstract: An on-line numerical database system, that is based on the concept of a weighted search tree and which functions like a file directory, is introduced. The system, which is designed to aid in reducing time-consuming redundant calculations in numerically intensive computations, can be used to fetch, **insert** and delete **items** from a dynamically generated list in optimal ($\theta(\log n)$ where n is the number of **items** in the list) time. **Items** in the list are **ordered** according to a **priority queue** with the initial **priority** for each element **set** either automatically or by an **user** supplied algorithm. The **priority**

queue is updated on-the-fly to reflect element hit frequency. **Items** can be **added** to a database so long as there is space to accommodate them, and when there is not, the lowest **priority** element(s) is removed to make room for an incoming element(s) with higher **priority**. The system acts passively and therefore can be applied to any number of databases, with the same or different structures, within a single application. (10 Refs)

Title: G-networks: a unifying model for neural and queueing networks

Author(s): Gelenbe, E.

Author Affiliation: Dept. of Electr. Eng., Duke Univ., Durham, NC, USA

Journal: Annals of Operations Research vol.48, no.1-4 p.433-61

Publication Date: Jan. 1994 Country of Publication: Switzerland

CODEN: AOREEV ISSN: 0254-5330

Language: English Document Type: Journal Paper (JP)

Treatment: Theoretical (T)

Abstract: Surveys results concerning a new stochastic network the author has developed, which was initially motivated by neural network modelling, or-as the author called it-by queueing networks with positive and negative customers. Indeed, it is well known that signals in neural networks are formed by impulses or action potentials, traveling much like customers in a queueing network. The author calls this model a G-network because it serves as a unifying basis for diverse areas of stochastic modelling in queueing networks, computer networks, computer system performance and neural networks. In its simplest version, "negative" and "positive" signals or **customers** circulate among a finite **set** of units, modelling inhibitory and excitatory signals of a neural network, or "negative and positive customers" of a queueing network. Signal can arrive either from other units or from the outside world. Positive signals are accumulated at the input of each unit, and constitute its signal potential. The state of each unit or neuron is its signal potential (which is equivalent to the **queue** length), while the network state is the vector of signal potentials at each neuron. If its potential is positive, a unit or neuron fires, and **sends** out signals to the other neurons or to the outside world. As it does so, its signal potential is depleted. In the Markovian case, this model has **product** form, i.e. the steady-state probability distribution of its potential vector is the **product** of the marginal probabilities of the potential at each neuron. The signal flow equations of the network, which describe the rate at which positive or negative signals arrive to each neuron, are non-linear. The author discusses the relationship between this model and the usual connectionist (formal) model of neural networks, and presents applications to combinatorial optimization and to image texture processing. Extensions of the model to the case of "multiple signal classes", and to "networks with triggered customer motion" are presented. The author also examines the general stability **conditions** which guarantee that the network has a well-defined steady-state behaviour. (22 Refs)

STATE-DEPENDENT SERVER SCHEDULING RULES IN POLLING SYSTEMS (LAN, PRODUCTION SYSTEMS, THRESHOLD STARTUP)

Author: GUNALAY, YAVUZ

Degree: PH.D.

Year: 1996

Corporate Source/Institution: MCMASTER UNIVERSITY (CANADA) (0197)

PAGE 3249. 156 PAGES

Descriptors: ENGINEERING, INDUSTRIAL ; OPERATIONS RESEARCH

Descriptor Codes: 0546; 0796

ISBN: 0-612-18487-0

A polling system is a cyclic queueing model with multiple customer classes and a single server. Each customer class has its own **queue** (station). After the server switches to a station, it serves **customers** waiting at that station according to a **specified** service regime, e.g., exhaustive, gated or globally gated. It then moves to the next station, following a strict cyclic **order**. These models have several application areas **including** computer and communication networks and multi- **item** production systems. For example, a Local Area Network (LAN) can be modeled as a polling system by defining the central processing unit as the server and the data transmission requests from each terminal as customers. Similarly, a multi- **item** production system can be modeled as a polling system by considering the flexible machining cell as the server and each **product** type as a different customer class. In most systems that polling models are used to represent, the server requires time to switch and/or setup before it may start serving a different customer class. These processes (switching/setup) may take considerable amounts of time, and when that happens, it is undesirable to setup for a **product** type if there are no (or only a few) jobs of that type in the system. Therefore, a server scheduling policy that ignores system state information can easily lead to suboptimal performance.

Whereas most previous studies on polling models have assumed that the server behaves independently of the state of the system, we discuss two kinds of state-dependent server scheduling rules: (i) the threshold setups model, and (ii) the threshold start-up model. In the former model, the server does not setup (and does not serve any customers) at a station at which it finds less than a critical number of waiting customers, called the

setup threshold. In the latter model, the server starts idling each time the system becomes empty and it stays idle until arrivals to the system reach a critical number, called the start-up threshold. The server then resumes service from the station where it had stopped. Our analysis makes it possible to compare system performance under these state-dependent server scheduling rules and state-independent rules.

In this dissertation the following results are achieved. We develop an exact analysis for the one-threshold setup model with two stations, and an efficient approximation for the same model with any number of stations. For the general threshold setups model, we construct a numerical solution technique which is near-exact for calculating **queue** length distributions and station mean waiting times. The threshold start-up model is analyzed in detail, and mathematically exact expressions for mean station waiting times are obtained for both exhaustive and globally gated service regimes. For each model, the extension to the gated service regime is also discussed.

**MAPPING REGULAR RECURSIVE ALGORITHMS TO FINE-GRAINED PROCESSOR ARRAYS
(PROCESSOR ARRAYS)**

Author: GANAPATHY, KUMAR NANJUNDA

Degree: PH.D.

Year: 1994

Corporate Source/Institution: UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN
(0090)

Adviser: BENJAMIN WAH

Source: VOLUME 55/09-B OF DISSERTATION ABSTRACTS INTERNATIONAL.

PAGE 3974. 174 PAGES

Descriptors: COMPUTER SCIENCE; ENGINEERING, ELECTRONICS AND ELECTRICAL

Descriptor Codes: 0984; 0544

With the continuing growth of VLSI technology, special-purpose parallel processors have become a promising approach in the quest for high performance. Fine-grained processor arrays have become popular as they are suitable for solving problems with a high degree of parallelism, and can be inexpensively built using custom designs or commercially available field programmable gate arrays (FPGA). Such specialised designs are often required in portable computing and communication systems with real-time constraints, as software-controlled processors often fail to provide the necessary throughput. This thesis addresses many issues in designing such application-specific systems built with fine-grained processor arrays for regular recursive uniform dependence algorithms. A uniform dependence algorithm consists of a set of indexed computations and a set of uniform dependence vectors which are independent of the indices of computations. Many important applications in signal/image processing, communications, and scientific computing can be formulated as uniform dependence algorithms.

The first part of this thesis addresses the problem of designing algorithm-specific processor arrays. A systematic **parameter**-based method, called the General **Parameter** Method (GPM), to design optimal, lower-dimensional processor arrays for uniform dependence algorithms has been developed. The GPM can be used to derive optimal arrays for any **user** - **specified** objective expressed in terms of the **parameters**. The proposed approach employs an efficient search technique to explore the design space and arrive at the optimal designs. The GPM can be used to find optimal designs in the dependence-based methods using the equivalence between the **parameter**-based and dependence-based methods. The GPM has also been

extended to derive optimal two-level pipelined algorithm-specific processor arrays. Such two-level pipelined arrays can be clocked at higher rates than can nonpipelined designs for real-time applications.

The second part of this thesis presents a parallel VLSI architecture for a general-purpose coprocessor for uniform dependence algorithms. The architecture consists of a linear array of processors and a linear chain of buffer memories organized as FIFO **queues** to store the buffered data. Such an architecture is advantageous from the point of view of scalability and wafer-level integration. A distinguishing feature is the assumption of a limited-bandwidth interface to external memory modules for accessing the data. Such an assumption allows the coprocessor to be integrated easily into existing systems. Efficient techniques to partition the dependence graph into blocks, sequence the blocks through the buffer memory to reduce the number of data accesses to main memory, and map the blocks using GPM have been developed. An important result obtained is the square-root relationship between clock-rate reduction and area of the coprocessor under fixed main-memory bandwidth. From the square-root relationship, it can be found that the system yield improves with the area of the coprocessor when chip yield decreases as the inverse square of the clock frequency. Results on matrix- **product** and transitive-closure applications indicate that the coprocessor can be used to **deliver** higher speedup or lower clock rate than a reference one-processor design. Thus, the coprocessor can be used as a general-purpose back-end accelerator for loop-based matrix algorithms.

AUTOMATIC PLANNING OF OPERATION SEQUENCES FOR ASSEMBLY ROBOTS

Original Title: AUTOMATISCHE PLANUNG VON OPERATIONSFOLGEN FUEHR
MONTAGEROBOTER

Author: BLESS, REMO

Degree: DR.SC.TECH

Year: 1992

Corporate Source/Institution: EIDGENOSSISCHE TECHNISCHE HOCHSCHULE
ZURICH (SWITZERLAND) (0663)

Source: VOLUME 54/02-C OF DISSERTATION ABSTRACTS INTERNATIONAL.

Mechanical assembly is an important area of application of robots. Robots are designed for flexible execution of complex motions. In contrast to specialized devices using fixed motion sequences, robots are capable of executing arbitrary sequences. Because of the necessarily detailed programming of every activity this flexibility has scarcely been exploited until now.

The discrepancy between the flexibility of robot hardware and robot programming cannot be overcome by new and more powerful programming languages as long as they describe the problem on the robot level and not on the task level. Besides allowing easier problem specification, the advantage of task level programming lies in the fact that only a goal has to be defined, but not the individual steps to achieve this goal.

This thesis presents an approach for operation sequence planning with flexible scheduling as part of a task level system for assembly robot

programming.

The operation sequence planning is based on a geometric model and not on explicit **user defined** precedence constraints between the individual components. A given assembly operation is admissible only if no collisions will occur during its execution. This **rule** is the basis for the automatic generation of precedence constraints. The choice of grippers has a major influence on the operation sequence and hence is taken into account. Other approaches either do not consider this influence or consider it too late.

Almost all known approaches in this field rely on certain **user defined** data but do not check its plausibility. This thesis deals with the recognition of **specification** errors and also presents possibilities to assist the user in eliminating them.

The actual operation sequences are determined at runtime, using the precedence constraints generated offline. Determining the operation sequences at this late stage of the planning process offers a high degree of flexibility. It is e.g. possible to use alternative operation sequences for appropriate reaction to arbitrary component **delivery sequences**. Furthermore the scheduling method presented here allows to handle a mix of **products** or variants of one **product** at the same time. Several strategies selectable at runtime allow to optimize certain criteria over the actual **product** mix.

The actual implementation on a real plant shows the usefulness of the approach.

Publishers also seek sales via Web

JAPAN: PUBLISHERS WENT ONLINE

The Nikkei Weekly (NW) 21 Jul 1997 P.9

Language: ENGLISH

Publishers in Japan enter a new era of trading with Shogakukan Inc opens its World Wide Web site on 18 July 1997. Its move has encouraged other publishers such as Kodansha Ltd and Iwanami Shoten to go online. Shogakukan, the first publisher to offer an Internet **book - ordering** service in Japan, has **provided** Internet **users** with an **ordering list** of over 3,000 **titles** on its site. Internet users can choose from a list of 9,000 stores that are located around Japan to which the **order** will be **sent** . In addition, overseas customers who use the service can have their **books delivered** through the parcel- **delivery** service. Kodansha Ltd, another publisher in Japan, started a similar service on 22 July 1997. However, Kodansha adopt a different strategy from that of Shogakukan as it only targets readers who do not have bookstores in their neighbourhood. Iwanami Shoten is planning to adopt such a channel to boost sales.
